Jan 13, 2019 lulzkit k0ba24a6b7 Conclusion What are the basics of the CMD (in the script above)? What are the typical patterns? What is the best way to handle this problem? A: The answer is to streamline the output. This can be achieved by Finding only the last 100 log lines Loading a larger buffer on stdout. Filtering out the mess Here is a modified version of your script: #!/bin/bash LOG_FILE="/var/log/check-conda-base-check.log" TOTAL_HOSTS=5 NUM_HOSTS=2 start() { local echo_buffer_size=1024 local echo_buffer_name="loop_buffer" local echo_buffer_pos=0 local -i count_logs=0 local -i total_host_processes=0 while IFS= read -r line || [[-n "\$line"]]; do printf "%s" "\$line" count_logs=\$((count_logs + 1)) if [["\$count_logs" -ge 100]]; then echo_buffer_pos=\$((echo_buffer_pos + \$count_logs)) # Write to stdout once the echo buffer has reached capacity if [["\$echo_buffer_pos" -gt "\$echo_buffer_size"]]; then echo -e "\$(TZ) \$(date) "\>> "\$LOG_FILE" echo -e "ProcessID: \$(ps aux | grep -v grep | grep -v "Exited" | awk '{ print \$2}')" "\ ba244e880a
