
Laplink PCmover V6 00 620 0 Professional Edition Portableadds 1

Laplink PCmover V6 00 620 0 Professional Edition Cracked Egg. Original korean version Manual. Iphone 4S mzd.Com... I had a look at it with readFileSync, no files were found. Thanks anyway. And here the code I used: `var fs = require('fs'); fs.readFileSync('/files/projectX/projectX-2016_01_20.sql', 'utf8', function(err, data) { if (err) { console.log('Error: ', err); } else { console.log('DATA: ', data); } });` A: The answer is, in your readFileSync function call, you have to pass in an encoding. `fs.readFileSync('/files/projectX/projectX-2016_01_20.sql', {encoding: 'utf-8'}, function(err, data) { this is actually described in the readFileSync documentation: If encoding is specified, the file is read by using the specified encoding with Buffer. In this case, Buffer requires a string encoding to read a string from. In your case, the string to read is actually the utf-8 encoded version of the file contents. You can also do it with a readFile and a callback, like this: fs.readFile('/files/projectX/projectX-2016_01_20.sql', 'utf-8', function(err, data) { // do stuff with data here });` This approach is also fine for files that contain a BOM. If your file doesn't have a BOM, then the first approach will work fine. A: So your code works fine, but is there any way to pass a string to be read as a buffer and avoid the extra step of having to convert the entire string into a buffer? Yes. If so, could you explain a little more? Files are stored on a filesystem that can be read using a string. A string contains bytes (a sequence of bytes). When you call readFileSync, the first argument is a string (in your case, the path of the file).
